CO2 - ASSESSMENT 2: SOCIAL ENGINEERING
SIMULATION

Course: Ethical Hacking (ITA1406)

Slot B

Faculty: Dr. K. Anbazhagan

Name: **P. Sudharshan Reddy** | Register Number: **192372204** | Assigned Website: **www.hp.com** (S.No. 14)

Code of Conduct: I, P. Sudharshan Reddy (192372204), certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the student: P.SUDHARSHAN REDDY

* Only publicly indexed pages were viewed (passive footprinting); nothing was accessed or tested. Counts may vary by search engine and date.

3. Security and social engineering analysis

Public PDFs: Privacy statements and policy PDFs reveal the company's legal entities, the names of its privacy office and officers, regional contact points, and the vendors and certification bodies it uses. An attacker can use these for pretexting, for example posing as the Privacy Office or a certification body.

Document metadata: PDFs, PPTs and DOCs often carry author names, software versions and internal paths in their metadata. These help build employee lists and email formats for phishing.

Login and admin pages: Indexed login or admin pages show where credentials are used. They can be copied into fake login pages for credential phishing. Admin pages should never be indexed.

Contact pages: Published emails, phone numbers and department names give attackers targets for vishing and spear phishing, and make impersonating support staff more believable.

Privacy policy: It lists the kinds of data HP collects and its partners, which an attacker can reference to make a fake data-request or breach notice look real.

4. Countermeasures

Strip metadata from documents before publishing. Block indexing of sensitive paths with robots.txt, noindex headers and authentication. Use role-based contact addresses instead of personal ones. Run regular Google dork audits of your own domain. Train staff to verify callers and senders, enforce

multi-factor authentication, and use email filtering such as SPF, DKIM and DMARC.
